**SUBSTITUTED 2-ANILINOPYRIMIDINES USEFUL AS PROTEIN  
KINASE INHIBITORS**

- 5    This invention relates to substituted 2-anilinopyrimidines, to processes for their preparation, to pharmaceutical compositions containing them, and to their use in medicine.

- 10    Protein kinases participate in the signalling events which control the activation, growth and differentiation of cells in response to extracellular mediators and to changes in the environment. In general, these kinases fall into two groups; those which preferentially phosphorylate serine and/or threonine residues and those which preferentially phosphorylate tyrosine residues [Hanks, S K, Hunter T, FASEB. J. 9, 576-596 (1995)].
- 15    The serine/threonine kinases include for example, protein kinase C isoforms [Newton A C, J. Biol. Chem. 270, 28495-28498 (1995)] and a group of cyclin-dependent kinases such as cdc2 [Pines J, Trends in Biochemical Sciences 18, 195-197 (1995)]. The tyrosine kinases include membrane-spanning growth factor receptors such as the epidermal growth
- 20    factor receptor [Iwashita S and Kobayashi M. Cellular Signalling 4, 123-132 (1992)], and cytosolic non-receptor kinases such as p56<sup>lck</sup> p59<sup>fyn</sup> ZAP-70 and csk kinases [Chan C *et al* Ann. Rev. Immunol. 12, 555-592 (1994)].
- 25    Inappropriately high protein kinase activity has been implicated in many diseases resulting from abnormal cellular function. This might arise either directly or indirectly, for example by failure of the proper control mechanisms for the kinase, related for example to mutation, overexpression or inappropriate activation of the enzyme; or by over- or
- 30    underproduction of cytokines or growth factors also participating in the transduction of signal upstream or downstream of the kinase. In all of these instances, selective inhibition of the action of the kinase might be expected to have a beneficial effect.
- 35    We have now found a series of substituted 2-anilinopyrimidines which are potent and selective inhibitors of protein kinases, especially the kinases

p56<sup>lck</sup>, p59<sup>fyn</sup>, ZAP-70 and protein kinase C. The compounds are thus of use in the prophylaxis and treatment of immune diseases, hyperproliferative disorders and other diseases in which inappropriate protein kinase action is believed to have a role.

When in the group  $-\text{Alk}(\text{R}^{13})_m$   $m$  is an integer 1, 2 or 3, it is to be understood that the substituent or substituents  $\text{R}^{13}$  may be present on any suitable carbon atom in  $-\text{Alk}$ . Where more than one  $\text{R}^{13}$  substituent is present these may be the same or different and may be present on the same or different atom in  $-\text{Alk}$  or in  $\text{R}^7$  as appropriate. Thus for example,  $\text{R}^7$  may represent a  $-\text{CH}(\text{R}^{13})_2$  group, such as a  $-\text{CH}(\text{OH})\text{Ar}$  group where Ar is an aryl or heteroaryl group as defined below. Clearly, when  $m$  is zero and no substituent  $\text{R}^{13}$  is present the alkylene, alkenylene or alkynylene chain represented by Alk becomes an alkyl, alkenyl or alkynyl group.

When  $\text{R}^{13}$  is a halogen atom it may be for example a fluorine, chlorine, bromine, or iodine atom.

Esterified carboxyl groups represented by the group  $\text{R}^{13}$  include groups of formula  $-\text{CO}_2\text{Alk}^1$  wherein  $\text{Alk}^1$  is a straight or branched, optionally substituted  $\text{C}_{1-8}$  alkyl group such as a methyl, ethyl, n-propyl, i-propyl, n-butyl, i-butyl, s-butyl or t-butyl group; a  $\text{C}_{6-12}\text{arylC}_{1-8}\text{alkyl}$  group such as an optionally substituted benzyl, phenylethyl, phenylpropyl, 1-naphthylmethyl or 2-naphthylmethyl group; a  $\text{C}_{6-12}\text{aryl}$  group such as an optionally substituted phenyl, 1-naphthyl or 2-naphthyl group; a  $\text{C}_{6-12}\text{aryloxyC}_{1-8}\text{alkyl}$  group such as an optionally substituted phenyloxymethyl, phenyloxyethyl, 1-naphthyloxymethyl, or 2-naphthyloxymethyl group; an optionally substituted  $\text{C}_{1-8}\text{alkanoyloxyC}_{1-8}\text{alkyl}$  group, such as a pivaloyloxymethyl, propionyloxyethyl or propionyloxypropyl group; or a  $\text{C}_{6-12}\text{aroyloxyC}_{1-8}\text{alkyl}$  group such as an optionally substituted benzoyloxyethyl or benzoyloxypropyl group. Optional substituents present on the  $\text{Alk}^1$  group include  $\text{R}^{13}$  substituents described above.

When Alk is present in or as a substituent  $\text{R}^{12}$  it may be for example a methylene, ethylene, n-propylene, i-propylene, n-butylene, i-butylene, s-butylene, t-butylene, ethenylene, 2-propenylene, 2-butenylene, 3-butenylene, ethynylene, 2-propynylene, 2-butyneylene or 3-butyneylene chain, optionally interrupted by one, two, or three  $-\text{O}-$  or  $-\text{S}-$ , atoms or  $-\text{S}(\text{O})-$ ,  $-\text{S}(\text{O})_2-$  or  $-\text{N}(\text{R}^{11})-$  groups.

Optionally substituted cycloalkyl groups represented by the group R<sup>13</sup> include optionally substituted C<sub>5-7</sub> cycloalkyl groups such as optionally substituted cyclopentyl or cyclohexyl groups.

Particular examples of such groups include optionally substituted azetidiny, pyrrolidiny, piperidiny, piperaziny, homopiperaziny, morpholiny or thiomorpholiny groups. The heterocyclo-  
10 alkyl group may be attached to the remainder of the molecule through any of its ring carbon atoms, or where present, ring nitrogen atom. Where the group R<sup>12</sup> is an -Alk-heterocycloalkyl group, Alk may be as defined above and the heterocycloalkyl portion may be as just defined, attached to Alk through any of its ring carbon atoms, or where present, ring nitrogen atom.

15 Optional substituents which may be present on R<sup>12</sup>, R<sup>13</sup> or R<sup>14</sup> cycloalkyl or heterocycloalkyl groups include one or two C<sub>1-6</sub> alkyl, e.g. methyl or ethyl, hydroxyl (-OH) hydroxyC<sub>1-6</sub>alkyl, e.g. hydroxymethyl or hydroxyethyl, or C<sub>1-6</sub> alkoxy, e.g. methoxy or ethoxy groups. The substituent(s) may be  
20 present on any available ring carbon or nitrogen atom as appropriate.

Aryl and heteroaryl groups represented by the groups R<sup>13</sup> or R<sup>14</sup> include for example optionally substituted monocyclic or bicyclic C<sub>6-12</sub> aromatic groups, or C<sub>1-9</sub> heteroaromatic groups such as those described above in  
25 relation to the group R<sup>7</sup>.

It will be appreciated that where two or more R<sup>12</sup> substituents are present, these need not necessarily be the same atoms and/or groups.

The presence of certain substituents in the compounds of formula (1) may enable salts of the compounds to be formed. Suitable salts include pharmaceutically acceptable salts, for example acid addition salts derived from inorganic or organic acids, and salts derived from inorganic and organic bases.

Acid addition salts include hydrochlorides, hydrobromides, hydroiodides, alkylsulphonates, e.g. methanesulphonates, ethanesulphonates, or isethionates, arylsulphonates, e.g. p-toluenesulphonates, besylates or napsylates, phosphates, sulphates, hydrogen sulphates, acetates, trifluoroacetates, propionates, citrates, maleates, fumarates, malonates, succinates, lactates, oxalates, tartrates and benzoates.

Salts derived from inorganic or organic bases include alkali metal salts such as sodium or potassium salts, alkaline earth metal salts such as magnesium or calcium salts, and organic amine salts such as morpholine, piperidine, dimethylamine or diethylamine salts.

Particularly useful salts of compounds according to the invention include pharmaceutically acceptable salts, especially acid addition pharmaceutically acceptable salts.

It will be appreciated that depending on the nature of the substituents R<sup>1</sup>, R<sup>3</sup> and R<sup>5</sup> - R<sup>7</sup> the compounds of formula (1) may exist as geometrical isomers and/or may have one or more chiral centres so that enantiomers or diastereomers may exist. It is to be understood that the invention extends to all such isomers of the compounds of formula (1), and to mixtures thereof, including racemates.

In one class of compounds of formula (1) the groups R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>7</sup> and X are as defined for formula (1), as is the group R<sup>6</sup> except it is not an amino, substituted amino, nitro, carboxyl or esterified carboxyl group.

One particular class of compounds according to the invention has the formula (1) wherein R<sup>2</sup> and R<sup>3</sup> is each an optionally substituted methyl or ethyl group. Particular examples of groups of these types include methyl,

ethyl, halomethyl, e.g.  $-\text{CH}_2\text{F}$ ,  $-\text{CH}_2\text{Cl}$ ,  $-\text{CHF}_2$ ,  $-\text{CHCl}_2$ ,  $-\text{CF}_3$ ,  $-\text{CCl}_3$ , or haloethyl groups. In general however,  $\text{R}^2$  and  $\text{R}^3$  is each preferably a methyl group. In compounds of this class and in general in compounds of formula (1)  $\text{R}^1$  may in particular be an optionally substituted methoxy group. Particular examples of such  $\text{R}^1$  groups include  $-\text{OCH}_2\text{F}$ ,  $-\text{OCH}_2\text{Cl}$ ,  $-\text{OCHF}_2$ ,  $-\text{OCHCl}_2$ ,  $-\text{OCF}_3$ ,  $-\text{OCCl}_3$  or, especially, methoxy groups.

In a further preferred class of compounds of formula (1)  $\text{R}^4$  is preferably a hydrogen atom.

The groups  $\text{R}^5$  and  $\text{R}^6$  in compounds of formula (1) are each preferably a hydrogen atom.

In yet another preference, X in compounds of formula (1) is a direct bond, an oxygen or sulphur atom or a  $-\text{N}(\text{R}^{11})-$  group. Especially useful compounds of this type are those wherein X is a direct bond, a sulphur atom or a  $-\text{N}(\text{R}^{11})-$ , particularly a  $-\text{NH}-$ , group.

$\text{R}^7$  in compounds of formula (1) is preferably an optionally substituted aromatic or heteroaromatic group.

A further class of compounds according to the invention has the formula 1(a):

1(a)

wherein  $\text{R}^5$  and  $\text{R}^6$  are as defined for formula (1), X is a direct bond, an oxygen or sulphur atom, or a group  $-\text{N}(\text{R}^{11})-$  and  $\text{R}^7$  is an optionally

substituted aromatic or heteroaromatic group, and the salts, solvates, hydrates and N-oxides thereof.

5 In these compounds,  $R^5$  is preferably a hydrogen atom.  $R^6$  is preferably a group  $-X^1R^{6a}$  where  $X^1$  is as defined for formula (1) and  $R^{6a}$  is an optionally substituted straight or branched chain alkyl group, or  $R^6$  is especially a hydrogen atom.

10 X in compounds of formula (1a) is preferably a direct bond, a sulphur atom, or a  $-N(R^{11})-$  group, particularly a  $-NH$ -group.

15 The aromatic or heteroaromatic  $R^7$  group in compounds of formulae (1) or 1(a) in general may be as defined previously for compounds of formula (1). In one preference, however,  $R^7$  is an optionally substituted phenyl, 1- or 2-naphthyl or heteroaromatic group containing one or two oxygen, sulphur and/or nitrogen atoms. Thus in particular  $R^7$  may be an optionally substituted phenyl, 1- or 2-naphthyl, pyrrolyl, furyl, thienyl, indolyl, pyrazolyl, thiazolyl, [2,3-dihydro]benzofuryl, benzothiazolyl, 2-pyridyl, 3-pyridyl or 4-pyridyl group. Particularly useful groups include optionally substituted phenyl, 2-pyridyl, 3-pyridyl or 4-pyridyl groups. The aromatic or heteroaromatic group may in particular be attached to the remainder of the compound of formula (1) through any available ring carbon atom.

25 In general, the optional substituents which may be present on aromatic or heteroaromatic  $R^7$  groups in compounds of formulae (1) or (1a) include one, two, or three  $R^{12}$  substituents as generally and particularly described above and hereinafter in the Examples. Particularly useful  $R^{12}$  substituents include  $-NHR^{14}$ ,  $-AlkNH_2$ ,  $-AlkNHR^{14}$ ,  $-OR^{14}$ ,  $-AlkCO_2H$  or  $-AlkCO_2Alk^1$  groups where  $R^{14}$ ,  $Alk$  and  $Alk^1$  are as generally and particularly defined above. Useful members of these substituents include those wherein  $R^{14}$  is an  $-Alk$ ,  $-AlkNH_2$  or  $-Alk$ -heterocycloalkyl group. In these, and the other preferred substituents just mentioned,  $Alk$  and  $Alk^1$  when present is each preferably a  $C_{1-6}$ alkyl group.

Compounds according to the invention are potent and selective inhibitors of protein kinases as demonstrated by differential inhibition of enzymes

25 such as EGFr kinase, p56<sup>lck</sup> kinase, ZAP-70 kinase, Csk kinase and p59<sup>lyn</sup> kinase. The ability of the compounds to act in this way may be simply determined by employing tests such as those described in the Examples hereinafter.

30 The compounds according to the invention are thus of particular use in the prophylaxis and treatment of diseases in which inappropriate protein tyrosine kinase action plays a role, for example in autoimmune diseases such as rheumatoid arthritis, multiple sclerosis, and systemic lupus erythematosus, in transplant rejection, in graft v host disease, in

35 hyperproliferative disorders such as tumours, psoriasis, in pannus formation in rheumatoid arthritis, restenosis following angioplasty and

atherosclerosis, and in diseases in which cells receive pro-inflammatory signals such as asthma, inflammatory bowel disease and pancreatitis.

For the prophylaxis or treatment of disease the compounds according to  
5 the invention may be administered as pharmaceutical compositions, and according to a further aspect of the invention we provide a pharmaceutical composition which comprises a compound of formula (1) together with one or more pharmaceutically acceptable carriers, excipients or diluents.

10 Pharmaceutical compositions according to the invention may take a form suitable for oral, buccal, parenteral, nasal, topical or rectal administration, or a form suitable for administration by inhalation or insufflation.

For oral administration, the pharmaceutical compositions may take the  
15 form of, for example, tablets, lozenges or capsules prepared by conventional means with pharmaceutically acceptable excipients such as binding agents (e.g. pregelatinised maize starch, polyvinylpyrrolidone or hydroxypropyl methylcellulose); fillers (e.g. lactose, microcrystalline cellulose or calcium hydrogen phosphate); lubricants (e.g. magnesium stearate, talc or silica); disintegrants (e.g. potato starch or sodium glycollate); or wetting agents (e.g. sodium lauryl sulphate). The tablets  
20 may be coated by methods well known in the art. Liquid preparations for oral administration may take the form of, for example, solutions, syrups or suspensions, or they may be presented as a dry product for constitution with water or other suitable vehicle before use. Such liquid preparations  
25 may be prepared by conventional means with pharmaceutically acceptable additives such as suspending agents, emulsifying agents, non-aqueous vehicles and preservatives. The preparations may also contain buffer salts, flavouring, colouring and sweetening agents as appropriate.

30 Preparations for oral administration may be suitably formulated to give controlled release of the active compound.

For buccal administration the compositions may take the form of tablets or  
35 lozenges formulated in conventional manner.

The compounds for formula (1) may be formulated for parenteral administration by injection e.g. by bolus injection or infusion. Formulations for injection may be presented in unit dosage form, e.g. in glass ampoule or multi dose containers, e.g. glass vials. The compositions for injection  
5 may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulatory agents such as suspending, stabilising, preserving and/or dispersing agents. Alternatively, the active ingredient may be in powder form for constitution with a suitable vehicle, e.g. sterile pyrogen-free water, before use.

10 In addition to the formulations described above, the compounds of formula (1) may also be formulated as a depot preparation. Such long acting formulations may be administered by implantation or by intramuscular injection.

15 For nasal administration or administration by inhalation, the compounds for use according to the present invention are conveniently delivered in the form of an aerosol spray presentation for pressurised packs or a nebuliser, with the use of suitable propellant, e.g. dichlorodifluoromethane, trichloro-  
20 fluoromethane, dichlorotetrafluoroethane, carbon dioxide or other suitable gas or mixture of gases.

The compositions may, if desired, be presented in a pack or dispenser device which may contain one or more unit dosage forms containing the  
25 active ingredient. The pack or dispensing device may be accompanied by instructions for administration.

The quantity of a compound of the invention required for the prophylaxis or treatment of a particular condition will vary depending on the compound  
30 chosen, and the condition of the patient to be treated. In general, however, daily dosages may range from around 100ng/kg to 100mg/kg e.g. around 0.01mg/kg to 40mg/kg body weight for oral or buccal administration, from around 10ng/kg to 50mg/kg body weight for parenteral administration and around 0.05mg to around 1000mg e.g.  
35 around 0.5mg to around 1000mg for nasal administration or administration by inhalation or insufflation.

The compounds of the invention may be prepared by a number of processes as generally described below and more specifically in the Examples hereinafter. In the following process description, the symbols  $R^1$ - $R^7$  and X when used in the formulae depicted are to be understood to represent those groups described above in relation to formula (1) unless otherwise indicated. In the reactions described below, it may be necessary to protect reactive functional groups, for example hydroxy, amino, thio or carboxy groups, where these are desired in the final product, to avoid their unwanted participation in the reactions. Conventional protecting groups may be used in accordance with standard practice [see, for example, Green, T. W. in "Protective Groups in Organic Synthesis", John Wiley and Sons, 1981]. In some instances, deprotection may be the final step in the synthesis of a compound of formula (1) and the processes according to the invention described hereinafter are to be understood to extend to such removal of protecting groups.

Thus according to a further aspect of the invention, a compound of formula (1) wherein X is a direct bond may be prepared by reaction of a guanidine of formula (2):

or a salt thereof  
with an enaminone of formula (3):

where  $R^{15}$  and  $R^{16}$ , which may be the same or different is each a  $C_{1-6}$  alkyl group.

The reaction may be performed in a solvent, for example a protic solvent such as an alcohol, e.g. ethanol, methoxyethanol or propanol, optionally in

the presence of a base e.g. an alkali metal base, such as sodium hydroxide or potassium carbonate, at an elevated temperature, e.g. the reflux temperature.

- 5 Salts of the compounds of formula (2) include acid salts such as inorganic acid salts e.g. hydrochlorides or nitrates.

Intermediate guanidines of formula (2) may be prepared by reaction of the corresponding aniline of formula (4):

10

with cyanamide at an elevated temperature.

- 15 The reaction may be performed in a solvent such as ethanol at an elevated temperature, e.g. up to the reflux temperature. Where it is desired to obtain a salt of a guanidine of formula (2), the reaction may be performed in the presence of a concentrated acid, e.g. hydrochloric or nitric acid.

20

- The anilines of formula (4) are either known compounds or may be obtained by conventional procedures, for example by hydrogenation of the corresponding nitro derivatives using for example hydrogen in the presence of a metal catalyst in a suitable solvent, for example as more particularly described in the interconversion reactions discussed below or by use of the corresponding nitro derivative and a reducing agent such as a sodium hydrosulphite in a solvent such as ethanol at an elevated temperature such as the reflux temperature. The nitrobenzenes for this particular reaction are either known compounds or may be prepared using similar methods to those used for the preparation of the known compounds, for example by treatment of the corresponding benzene with
- 25
- 30

nitric acid in the presence of an acid such as acetic acid at around ambient to the reflux temperature.

Intermediate enamines of formula (3) may be prepared by reaction of an acetyl derivative  $R^7COCH_2R^6$  with an acetal  $(R^{16})(R^{15})NCR^5(OCH_3)_2$  at an elevated temperature. The starting materials for this reaction are either known compounds or may be prepared by methods analogous to those used for the preparation of the known compounds.

In another process according to the invention, a compound of formula (1) where X is a linker atom or group may be prepared by reaction of an intermediate of formula (5)

(5)

15

where L is a leaving atom or group, with a reagent  $R^7X_2H$  where  $X_2$  is a linking atom or group as defined above.

Particular leaving atoms or groups represented by L include for example halogen atoms, e.g. bromine, iodine or chlorine atoms, and sulphonyloxy groups, e.g. alkylsulphonyloxy groups, such as trifluoromethylsulphonyloxy, and arylsulphonyloxy groups, such as p-toluenesulphonyloxy.

20

The reaction may be performed in the presence of a base, for example an organic base such as an organic amine, e.g. triethylamine or an inorganic base, for example a hydride such as sodium hydride, an alkoxide such as potassium t-butoxide, or a carbonate such as caesium or potassium carbonate, where necessary in the presence of a dipolar aprotic solvent

25

such as an ether, e.g. a cyclic ether such as tetrahydrofuran, or an amide, e.g. a substituted amide such as dimethylformamide, at a suitable temperature e.g. from around room temperature to around 90°C.

- 5 Intermediates of formula (5) may be prepared by reaction of the corresponding pyrimidinones (where  $-N=C(L)-$  in formula (5) is  $-NH-C(O)-$ ) with a halide using standard procedures, for example by reaction with a reagent  $PO(Hal)_3$  (where Hal is a halogen atom), e.g.  $POCl_3$ , or  $RSO_2Hal$  (where R is an optionally substituted alkyl or aryl group) where necessary  
10 at an elevated temperature.

The starting pyrimidinones may be prepared by reaction of a guanidine of formula (2) or a salt thereof with a  $\beta$ -ketoester [for example a compound  $CH_3CH_2C(O)OCH(R^6)C(O)R^5$  (where  $R^5$  is an optionally substituted alkyl, alkenyl or alkynyl group)] or a functional analogue thereof where it is  
15 desired to obtain compounds wherein  $R^5$  is a hydrogen atom, in the presence of a base, for example an alkoxide such as sodium methoxide in a solvent, for example a protic solvent, such as an alcohol, e.g. methanol at an elevated temperature, e.g. up to around the reflux temperature.

20

In a further process according to the invention, a compound of formula (1) may be prepared by displacement of a leaving atom or group in a pyrimidine of formula (6):

25

(6)

[where L is a leaving atom or group as defined above] with an aniline of formula (4).

- 30 The reaction may be performed at an elevated temperature, for example the reflux temperature, where necessary in the presence of a solvent, for example a ketone such as acetone, an alcohol such as ethanol or 2-

ethoxyethanol or an aromatic hydrocarbon such as toluene, optionally in the presence of a base, for example an organic amine such as triethylamide or pyridine, or an acid, for example an inorganic acid such as hydrochloric acid.

5

Intermediate pyrimidines of formula (6) may be prepared by displacement of a leaving group from a pyrimidine of formula (7):

10

[where L<sup>1</sup> is a leaving atom or group as described above for the group L] using a nucleophilic reagent R<sup>7</sup>XH. The reaction may be performed as just described in relation to the preparation of compounds of formula (1) from the intermediate pyrimidines of formula (6).

15

The pyrimidines of formula (7) and the nucleophilic reagents R<sup>7</sup>XH are either known compounds or may be prepared using methods analogous to those used for the preparation of the known compounds.

20

In another process according to the invention, a compound of formula (1) wherein X is a -C(O)- group may be prepared by treating a carboxamide of formula (8):

[where  $X^3$  is a carboxamide group] with a reagent  $R^7M\text{Hal}^1$  (where M is a metal atom such as an zinc atom and  $\text{Hal}^1$  is a halogen atom, such as a bromine atom).

The group  $X^3$  in intermediates of formula (8) may be for example a group  $-\text{CONR}^{15}\text{R}^{16}$  or  $-\text{CON}(\text{R}^{15})(\text{OR}^{16})$ .

The reaction may be performed in a solvent such as an ether, e.g. a cyclic ether such as a tetrahydrofuran, at a low temperature, e.g. around  $-78^\circ\text{C}$ .

Intermediate carboxamides of formula (8) may be prepared by reaction of the corresponding acid of formula (9):

or a reactive derivative thereof with a reagent  $\text{R}^{15}\text{R}^{16}\text{NH}$  or  $\text{R}^{15}\text{R}^{16}\text{ONH}$  in the presence of a base e.g. an organic amine such as triethylamine in a

solvent such as dichloromethane at a low temperature, e.g. around -20° to 0°C.

5 Intermediate acids of formula (9) may be prepared by heating the corresponding nitrile in the presence of a base such as sodium hydroxide in a solvent such as ethanol. The nitrile starting material may be prepared by heating 2-chloro-4-cyano-pyrimidine with the appropriate aniline in the presence of a base such as triethylamine in a solvent such as ethanol at the reflux temperature.

10

Acids of formula (9) may also be used to generate compounds of formula (1) wherein X is a -NHC(O)O- group by reaction with an azide, for example diphenylphosphorylazide, and an alcohol R<sup>7</sup>OH in the presence of a base such as triethylamine at an elevated temperature, e.g. the reflux temperature.

15

Compounds of formula (1) may also be prepared by interconversion of other compounds of formula (1) and it is to be understood that the invention extends to such interconversion processes. Thus, for example, standard substitution approaches employing for example alkylation, arylation, acylation, thioacylation, sulphonylation, formylation or coupling reactions may be used to add new substituents to and/or extend existing substituents in compounds of formula (1). Alternatively existing substituents in compounds of formula (1) may be modified by for example oxidation, reduction or cleavage reactions to yield other compounds of formula (1).

20

25

The following describes in general terms a number of approaches which can be employed to modify existing R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, R<sup>5</sup> and/or R<sup>6</sup> groups in compounds of formula (1). It will be appreciated that each of these reactions may only be possible where an appropriate functional group exists in a compound of formula (1). Equally, any of the following reactions may be used to generate appropriately substituted intermediates of formulae (2), (4), (5), (6) and (7) for use in the preparation of compounds of formula (1).

30

35

Thus, for example alkylation or arylation of a compound of formula (1) may be achieved by reaction of the compound with a reagent  $R^4L$ ,  $AlkL$  or  $ArL$ , where  $R^4$ ,  $Alk$ ,  $Ar$  and  $L$  are as previously defined.

- 5 The alkylation or arylation reaction may be carried out in the presence of a base, e.g. an inorganic base such as a carbonate, e.g. caesium or potassium carbonate, an alkoxide, e.g. potassium t-butoxide, or a hydride, e.g. sodium hydride, in a dipolar aprotic solvent such as an amide, e.g. a substituted amide such as dimethylformamide or an ether, e.g. a cyclic  
10 ether such as tetrahydrofuran, at around  $0^{\circ}C$  to around  $40^{\circ}C$ .

In a variation of this process the leaving group  $L$  may be alternatively part of the compound of formula (1) and the reaction performed with an appropriate nucleophilic reagent in a solvent such as an alcohol, e.g.  
15 ethanol, at an elevated temperature, e.g. the reflux temperature.

In another general example of an interconversion process, a compound of formula (1) may be acylated or thioacylated. The reaction may be performed for example with an acyl halide or anhydride in the presence of  
20 a base, such as a tertiary amine e.g. triethylamine in a solvent such as a halogenated hydrocarbon, e.g. dichloromethane or carbon tetrachloride, or an alcohol, e.g. methanol at for example ambient temperature, or by reaction with a thioester in an inert solvent such as tetrahydrofuran at a low temperature such as around  $0^{\circ}C$ . The reaction is particularly suitable  
25 for use with compounds of formula (1) containing primary or secondary amino groups.

In a further general example of an interconversion process, a compound of formula (1) may be formylated, for example by reaction of the compound  
30 with a mixed anhydride  $HCOOCOCH_3$  or with a mixture of formic acid and acetic anhydride.

Compounds of formula (1) may be prepared in another general interconversion reaction by sulphonylation, for example by reaction of the  
35 compound with a reagent  $AlkS(O)_2L$ , or  $ArS(O)_2L$  in the presence of a base, for example an inorganic base such as sodium hydride in a solvent

such as an amide, e.g. a substituted amide such as dimethylformamide at for example ambient temperature. The reaction may in particular be performed with compounds of formula (1) possessing a primary or secondary amino group.

5

In further examples of interconversion reactions according to the invention compounds of formula (1) may be prepared from other compounds of formula (1) by modification of existing functional groups in the latter.

- 10 Thus in one example, ester groups  $-\text{CO}_2\text{Alk}^1$  in compounds of formula (1) may be converted to the corresponding acid  $[-\text{CO}_2\text{H}]$  by acid- or base-catalysed hydrolysis or by catalytic hydrogenation depending on the nature of the group  $\text{Alk}^1$ . Acid- or base-catalysed hydrolysis may be achieved for example by treatment with an organic or inorganic acid, e.g.
- 15 trifluoroacetic acid in an aqueous solvent or a mineral acid such as hydrochloric acid in a solvent such as dioxan or an alkali metal hydroxide, e.g. lithium hydroxide in an aqueous alcohol, e.g. aqueous methanol. Catalytic hydrogenation may be carried out using for example hydrogen in the presence of a metal catalyst, for example palladium on a support such
- 20 as carbon in a solvent such as an ether, e.g. tetrahydrofuran or an alcohol, e.g. methanol. Similarly, base-catalysed hydrolysis with for example an alkali metal hydroxide such as sodium hydroxide in a solvent such as an alcohol e.g. ethanol may be used to convert a  $>\text{NSO}_2\text{Alk}$  or  $>\text{NSO}_2\text{Ar}$  group to a  $>\text{N-H}$  group.

25

- In a second example,  $-\text{OAlk}^2$  [where  $\text{Alk}^2$  represents an alkyl group such as a methyl group] groups in compounds of formula (1) may be cleaved to the corresponding alcohol  $[-\text{OH}]$  by reaction with boron tribromide in a solvent such as a halogenated hydrocarbon, e.g. dichloromethane at a low
- 30 temperature, e.g. around  $-78^\circ\text{C}$ .

- Alcohol  $[-\text{OH}]$  groups may also be obtained by hydrogenation of the corresponding  $-\text{OCH}_2\text{Ar}$  group using for example hydrogen in the presence of a metal catalyst, for example palladium on a support such as
- 35 carbon in a solvent such as ethanol in the presence of ammonium formate. In another example,  $-\text{OH}$  groups may be generated from the

corresponding ester [-CO<sub>2</sub>Alk] by reduction using for example a complex metal hydride such as lithium aluminium hydride.

- 5 In a further example, alcohol -OH groups in compounds of formula (1) may be converted to a corresponding -OAlk or -OAr group by coupling with a reagent AlkOH or ArOH in a solvent such as tetrahydrofuran in the presence of a phosphine, e.g. triphenylphosphine and an activator such as diethyl-, diisopropyl-, or dimethylazodicarboxylate.
- 10 In another example of an interconversion reaction, amines of formula (1) may be alkylated using a reductive alkylation process employing an aldehyde and a borohydride, for example sodium triacetoxyborohydride, in a solvent such as dichloromethane, in the presence of an acid such as acetic acid at around ambient temperature.
- 15 Aminosulphonylamino [-NHSO<sub>2</sub>NH<sub>2</sub>] groups in compounds of formula (1) may be obtained, in another example, by reaction of a corresponding amine [-NH<sub>2</sub>] with sulphamide in the presence of an organic base such as pyridine at an elevated temperature, e.g. the reflux temperature.
- 20 In a further example, amine [-NH<sub>2</sub>] groups in compounds of formula (1) may be obtained by hydrolysis from a corresponding imide by reaction with hydrazine in a solvent such as an alcohol, e.g. ethanol at ambient temperature.
- 25 In another example, a nitro [-NO<sub>2</sub>] group may be reduced to an amine [-NH<sub>2</sub>], for example by catalytic hydrogenation as just described, or by chemical reduction using for example a metal, e.g. tin or iron, in the presence of an acid such as hydrochloric acid, optionally in a solvent such as an alcohol, e.g. methanol.
- 30 In a further example of an interconversion process, a tetrazole substituent may be obtained from the corresponding nitrile by treatment of the latter with an azide, e.g. sodium azide, in a solvent such as a substituted amine, e.g. dimethylformamide at an elevated temperature.
- 35

N-oxides of compounds of formula (1) may be prepared for example by oxidation of the corresponding nitrogen base using an oxidising agent such as hydrogen peroxide in the presence of an acid such as acetic acid, at an elevated temperature, for example around 70°C to 80°C, or alternatively by reaction with a peracid such as peracetic acid or 3-chloroperoxybenzoic acid in a solvent, e.g. dichloromethane, at ambient temperature.

Where salts of compounds of formula (1) are desired, these may be prepared by conventional means, for example by reaction of a compound of formula (1) with an appropriate acid or base in a suitable solvent or mixture of solvents, e.g. an organic solvent such as an ether, e.g. diethylether, or an alcohol, e.g. ethanol.

The following Examples illustrated the invention. In the Examples all <sup>1</sup>Hnmr were run at 300MHz unless specified otherwise. All temperatures are in °C. The following abbreviations are used: DMSO - dimethylsulphoxide; DMF - dimethylformamide; THF - tetrahydrofuran.

### **BIOLOGICAL ACTIVITY**

The following assays were used to demonstrate the activity and selectivity of compounds according to the invention:

5

#### **p56<sup>lck</sup> kinase assay**

The tyrosine kinase activity of p56<sup>lck</sup> was determined using a RR-src peptide (RRLIEDNEYTARG) and [ $\gamma$ -<sup>33</sup>P]ATP as substrates. Quantitation of the <sup>33</sup>P-phosphorylated peptide formed by the action of p56<sup>lck</sup> was achieved using an adaption of the method of Geissler *et al* (J. Biol. Chem. (1990) 265, 22255-22261).

All assays were performed in 20mM HEPES pH 7.5 containing 10mM MgCl<sub>2</sub>, 10mM MnCl<sub>2</sub>, 0.05% Brij, 1 $\mu$ M ATP (0.5 $\mu$ Ci [ $\gamma$ -<sup>33</sup>P]ATP) and 0.8mg/ml RR-src. Inhibitors in dimethylsulphoxide (DMSO) were added such that the final concentration of DMSO did not exceed 1%, and enzyme [human p56<sup>lck</sup>] such that the consumption of ATP was less than 10%. After incubation at 30°C for 15min, the reaction was terminated by the addition of one-third volume of stop reagent (0.25mM EDTA and 33mM ATP in dH<sub>2</sub>O). A 15 $\mu$ l aliquot was removed, spotted onto a P-30 filtermat (Wallac, Milton Keynes, UK), and washed sequentially with 1% acetic acid and dH<sub>2</sub>O to remove ATP. The bound <sup>33</sup>P-RR-src was quantitated by scintillation counting of the filtermat in a Betaplate scintillation counter (Wallac, Milton Keynes, UK) after addition of Meltilex scintillant (Wallac, Milton Keynes, UK). The dpm obtained, being directly proportional to the amount of <sup>33</sup>P-RR-src produced by p56<sup>lck</sup>, were used to determine the IC<sub>50</sub> for each compound.

#### **p59<sup>fyn</sup> kinase assay**

Compounds of the invention were assayed for p59<sup>fyn</sup> inhibitory activity in a similar manner to the p56<sup>lck</sup> assay, using human p59<sup>fyn</sup>.

#### **EGFr kinase assay**

The tyrosine kinase activity of the EGF receptor (EGFr) was determined using a similar methodology to the p56<sup>lck</sup> kinase assay, except that the RR-src peptide was replaced by a peptide substrate for EGFr obtained

from Amersham International plc (Little Chalfont, UK) and used at the manufacturers recommended concentration. IC<sub>50</sub> values for each test inhibitor were determined as described previously in the p56<sup>lck</sup> assay.

5    **ZAP-70 kinase assay**

The tyrosine kinase activity of ZAP-70 was determined using a capture assay based on that employed above for p56<sup>lck</sup>. The RR-src peptide was replaced with polyGlu-Tyr (Sigma; Poole, UK) at a final concentration of 17 µg/ml. After addition of the stopped reaction to the filtermat, trichloroacetic acid 10% (w/v) was employed as the wash reagent instead of acetic acid and a final wash in absolute ethanol was also performed before scintillation counting. IC<sub>50</sub> values for each test inhibitor were determined as described above in the p56<sup>lck</sup> assay.

15   **Csk kinase assay**

Compounds of the invention were assayed for csk kinase inhibitory activity in a similar manner to the ZAP-70 assay using human csk kinase.

**Protein kinase C assay**

20   Inhibitor activity against protein kinase C (PKC) was determined using PKC obtained from Sigma Chemical Company (Poole, UK) and a commercially available assay system (Amersham International plc, Little Chalfont, UK). Briefly, PKC catalyses the transfer of the γ-phosphate (<sup>32</sup>P) of ATP to the threonine group on a peptide specific for PKC.

25   Phosphorylated peptide is bound to phosphocellulose paper, subsequently quantified by scintillation counting and IC<sub>50</sub> values determined as before.

In the above assays, compounds according to the invention, including the compounds of the Examples inhibit the protein kinase p56<sup>lck</sup>, p59<sup>lyn</sup>, ZAP-70 or protein kinase C at concentrations at which they have little or no effect on the remaining kinases, including EGFr kinase and Csk kinase. Thus, for example the compounds of Example 96 and 103 have IC<sub>50</sub> values in the p56<sup>lck</sup> assay of 215nM and 40nM respectively. The compounds are also active against p59<sup>lyn</sup> but have IC<sub>50</sub> values at least 10x greater against the remaining kinases described above. In another example the compounds of Example 64 and 66 have IC<sub>50</sub> values in the

- ZAP-70 assay of 124nM and 68nM respectively. The compounds are also active in the protein kinase C assay, but have  $IC_{50}$  values at least 10x greater against the remaining kinases. In a further example, the compounds of Examples 48 and 81 have  $IC_{50}$  values in the protein kinase
- 5 C assay of 22nM and 92nM respectively, but have  $IC_{50}$  values at least 10x greater against the remaining kinases.
